I've read your PRD, **SendFlow — 01 · Documento de Requisitos de Producto, version 1.0, dated October 10, 2026**. My first impression: this is a much more specific product than a conventional MTB coaching app. SendFlow is an integrated ecosystem for downhill and enduro, combining bike telemetry, suspension analysis, video coaching, athlete–coach communication, and eventually suspension workshop services.

The most important thing I see is that **SendFlow Coach is not simply a training-plan generator**. It is a coaching workflow built around real riding footage and telemetry from the Sender device. The PRD explicitly rules out AI-generated training plans, a general social feed, and several other feature ideas. I'll treat those exclusions as deliberate product decisions, not recommend adding them casually.

01_PRD.md

1. What I think is strongest

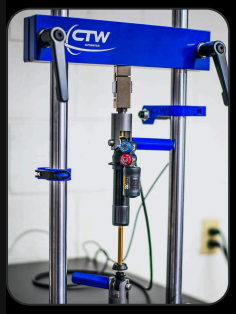

1. A differentiated core product

Sender data at 1,000 Hz, suspension behavior, GPS, video synchronization, and coach annotations give SendFlow a clear identity. The combination is more distinctive than a standalone video-review tool.

2. A well-defined coaching workflow

Sending a video or data-only run, marking moments, receiving annotated feedback, messaging, and submitting corrections creates a complete feedback loop. Supporting data-only analysis is especially interesting because the coach can still work without video.

3. A coherent long-term ecosystem

SendFlow Bike, Coach, and Lab can share athlete profiles and authorized riding history. That could connect riding behavior to suspension setup and maintenance in a way that separate products cannot.

2. My biggest concern: scope versus validation

Your PRD is unusually detailed about intended behavior. That is good for implementation, but the status column reveals a crucial distinction.

Built or working with simulated data

Many Coach features are marked `HECHO`, including video analysis, messaging, data-only analysis, and training plans. That demonstrates implementation progress, but simulated data does not establish reliability with real athletes, real videos, or real telemetry.

Still awaiting real-world validation

Uploading long videos, synchronizing GoPro footage with Sender data, delivering notifications, accepting coach invitations, and validating suspension recommendations all have important real-world tests remaining.

Several products are advancing together

Hardware, offline mobile software, two websites, cloud synchronization, video processing, and a future workshop platform create a substantial testing and maintenance burden.

My recommendation is to prioritize **proving the complete athlete-to-coach workflow before expanding the feature set**. The PRD itself supports this approach: it repeatedly distinguishes simulated functionality from features validated with real equipment or users.

01_PRD.md

3. What I would improve in the PRD

These are improvements to the specification and delivery process—not suggestions to expand your product scope.

A. Define a clear launch gate for SendFlow Coach

The PRD contains a lot of feature-level acceptance criteria, but I would add one explicit end-to-end release checklist.

Coach launch checklist

4 of 8 verified

- [x] A real pilot can register or sign in, get approved, and accept an invitation.
- [x] The pilot can upload a real video and/or a real Sender recording.
- [ ] Large uploads complete, recover from interruption, and do not create duplicate submissions.
- [x] The coach can open the submission, synchronize footage and data, and save an analysis.
- [x] The pilot receives the feedback and can view annotations, messages, and any correction request.
- [ ] A second real athlete cannot access the first athlete’s private videos, telemetry, or conversations.

- ◯ The workflow works on the supported desktop and mobile browsers.
- ◯ Errors, failed uploads, missing telemetry, and notification failures are visible and recoverable.

This is a proposed release gate, not a claim that these tests have already passed.

B. Make data ownership and permissions explicit

Your rule that nobody can see another person's data without permission is essential.

01_PRD.md

I would make sure the technical specification defines, for every relevant object:

- Who owns it: pilot, coach, or system.
- Who can read, edit, download, share, or delete it.
- What happens when a pilot removes a coach.
- What happens to shared videos and analyses when an account or relationship is deleted.
- Whether a coach can retain an analysis that was already created after the relationship ends.
- How signed media links, session authentication, and cross-subdomain access are protected.

This is particularly important because Coach and Bike share an account and database, while the product also handles potentially sensitive location traces, videos, and personal performance data.

C. Specify failure cases, not only successful cases

For the most important workflows, add explicit acceptance criteria for failure and recovery.

Workflow	Questions the specification should answer
Video upload	What happens if the connection drops halfway through? Can an upload resume safely?
Sender synchronization	What if the video and telemetry clocks differ or the GPS data is missing?
Messaging	What happens if a message saves but its email notification fails?
Plan completion	Can an athlete mark a session complete twice, or edit a past completion?
Cloud synchronization	What happens if the same run is uploaded twice or two versions conflict?
Deletion	Which files, derived analyses, and references are actually deleted?

These cases are more valuable to resolve now than adding more UI features.

D. Tighten the requirements document itself

A few things stood out in the document:

- **Duplicate identifier:** `W9` is used for both sending a run to a coach and legal text requirements. Give each requirement a unique ID.
- **Mixed status conventions:** Some features marked `HECHO` still have real-device or real-user validation pending. Consider tracking implementation status and validation status separately.
- **Cross-document dependencies:** The PRD references documents 02–06, SQL migrations, hardware specifications, and external credentials. Acceptance criteria should point to a stable version of each dependency.
- **Unclear launch boundary:** Coach's second-stage planning is already partly implemented, while the hardware and core telemetry still need real-world validation. Define what must work before you call the product ready for paying customers.

These are mostly specification hygiene issues, but they make a real difference once several components evolve in parallel.

01_PRD.md

4. What I would prioritize next

My proposed order, based on the requirements and statuses in your PRD:

01 **Validate the critical path**

Highest priority

Test a real athlete account, real upload, coach analysis, feedback delivery, and privacy boundaries. Resolve failures across the entire workflow rather than testing each screen in isolation.

02 **Validate the Sender-to-Coach data path**

Test an actual recording from the device through download, cloud upload, Coach analysis, and synchronization with real video. Verify timing and missing-data handling before treating derived metrics as reliable.

03 **Run a small real-coach pilot**

Validate invitations, review time, feedback quality, corrections, and whether coaches can manage multiple athletes without confusion. Test the manual training-plan workflow with an actual coach as the PRD requires.

04 **Prepare for public use**

Complete privacy/legal review, verify account approval and deletion, establish backups and monitoring, and test mobile browser behavior and large media uploads.

05 **Resume secondary development**

Once the critical path is stable, continue with the planned training features, offline Coach support, hardware-dependent analytics, and later Lab integration according to your existing phases.

5. One important distinction about the training plans

Your PRD includes coach-created seasonal plans with phases, exercises, race preparation, and athlete completion tracking. It explicitly excludes training plans generated by AI.

01_PRD.md

I would preserve that distinction. For the current product, the goal should be to make coach-authored plans easy to create, communicate, follow, and evaluate—not to introduce an automated training engine that the requirements deliberately rule out.

My overall verdict

The PRD has a strong product identity and unusually concrete requirements. The biggest risk is not a lack of features; it is validating the whole ecosystem before treating the implemented features as production-ready.

The next step for my review is to connect this specification to the actual application. I can now use the PRD as the baseline for evaluating sendflow.coach ↗, identifying which requirements are visible in the product, which flows appear incomplete, and where implementation or UX may diverge from the specification.

I have reviewed the PRD, but I have not yet verified the live application against it.
