Here's a concrete UI layout for the Rider mode (the beginner-friendly version).

I've designed it as a mobile-first vertical layout (typical phone screen). Everything is meant to feel clean, scannable, and non-overwhelming.

1. After-Ride / Home Screen (Rider Mode)

text

2. What happens when the user taps a traffic-light card

Example: user taps the yellow “Bottoms” card

```text
┌──────────────────────────────────────────┐
│  Bottoms – 3 times                       │
│                                          │
│  You reached full travel 3 times.        │
│  This usually means the spring is a bit soft │
│  or the high-speed compression is too open.  │
│                                          │
│  Biggest ones:                           │
│  • 1:12 – Rear bottom (hard)             │
│  • 2:48 – Both ends                      │
│  • 3:55 – Rear bottom                    │
│                                          │
│  [ See on map ]   [ Show advanced data ]     │
└──────────────────────────────────────────┘
```

“Show advanced data” only appears if they are in Intermediate/Expert mode, or it switches them temporarily.

3. Expanded “Show more details” section

When the user taps “▸ Show more details”, the screen grows with a few extra simple cards (still not the full Expert view):

```text
```

```
│  ▾ Show more details                          │
│                                               │
│  TRAVEL USED                                  │
│  Front  68%          Rear  81%                │
│  ███████▒            ████████▒                │
│                                               │
│  REBOUND                                      │
│  Front: a bit slow     Rear: good             │
│                                               │
│  BIGGEST HITS                                 │
│  1. 1:12  –  Strong rear impact               │
│  2. 2:48  –  Both ends bottomed               │
│  3. 3:55  –  Hard rear impact                 │
│                                               │
│  [ Open full Expert view ]                    │  ← Only if they want everything
```

4. Mode switcher (always available)

Put a small, non-intrusive control in the top-right or in Settings:

```
text
```

```
Complexity:  [ Rider ▼ ]
             • Rider
             • Intermediate
             • Tuner / Expert
```

Or a segmented control on the home screen for power users.

5. Visual style guidelines for this layout

- Large, readable numbers and short labels
- Lots of white space
- Traffic lights are the visual anchors (green / yellow / red)
- One primary recommendation in a highlighted card
- Map is simplified (only bottoms + jumps + maybe the line of the run)
- No dense tables, no small text, no multiple graphs at once
- Every card is tappable for a short explanation

6. Quick comparison of the three modes on the same screen

Element	Rider mode	Intermediate	Expert
Key stats	Time, max speed, jumps	+ average speed, hits	Full stats
Traffic lights	3–4 main ones	5–6	Full set + engineer order
Recommendation	1 clear action	1 –2 actions	Detailed suggestions
Map	Only bottoms + jumps	+ more events	All layers + 3D
Extra sections	Collapsed by default	Some open	Everything visible
Graphs / histograms	Hidden	Simple versions	Full set

Would you like me to also show the layout for the **Setup / Live SAG screen** in Rider mode, or the **expanded Expert version** of the same after-ride screen so you can see the contrast?
